

## QIMRB GUARDIANS User Story 2: Use Case Diagram

**User Story 2:** As a Data Controller (or Data Owner), I want to be appropriately acknowledged for the supply of data and be informed as to its use, so that we can report to our funders and demonstrate additional impact from the data.

\* REMS (Resource Entitlement Management System) is a system used to electronically manage data access requests. It may be substituted with an alternate system, with the same function.

\*\* In order to be able to trace publications, it will be necessary as part of the data access request process, to have captured the data applicant's ORCID ID and obtain their commitment to use it in any publication.

\*\*\* Currently, there is no global unique identifier for a dataset apart from its URN or DOI, if it has one. Therefore I have not described an automatic process to find publications associated a particular dataset.
